INTERPRETATION:

Liver function tests (LFTs), are a group of blood tests that evaluate the functioning of the liver and detect the presence of various liver diseases. If your liver isn't working properly, it can affect your overall health. That's because the liver plays lots of different roles of the body, such as storing fuel from food, making proteins the body needs, and helping to remove toxins. LFT may also be used to monitor the body's response to a specific course of treatment of diseases like cirrhosis or hepatitis
